

# Wyoming Medusahead/Ventenata Field Tour

## June 14, 2017 in Sheridan, WY

With the confirmation of medusahead and ventenata in Wyoming last summer, the field day will focus on the identification and treatment of these new invasive annual grasses and will also include the potential impacts, what is currently being done, current and future partnerships, and plans moving forward. We will demonstrate how to efficiently report infestations to aid ongoing survey and inventory efforts and will visit a field site where both species have been identified and treatments have been applied.

**Lunch will be provided!**

Please register at <https://wymedusa.eventbrite.com> no later than June 7!

The Northeast Wyoming Invasive Grass Working Group consists of multiple partners from local, state, and national organizations working together to reduce the impacts of these emerging threats to rangeland ecosystems and is supported from various sources for which we are grateful.
